Expected hours/day 7

This sample demonstrates a burn down for a completed sprint. The tasks are tracked individually, with each day showing how many hours were predicted for each task, and how many hours were actually spent. In this case, a work day was estimated as 7 hours of productive time, and the actual work day was 5 to 7 hours, as the actual work hours fluctuate daily. The sprint was predicted to end on 1/15, due to fluctuations the work was completed on the next work day, 1/18.
